

Here are the basic commands for starting and stopping your VM.

Remember, you must be in the same directory as the VM to make anything work.

To start the machine:

```
vagrant up
```

To enter the machine from your terminal/console:

```
vagrant ssh
```

To stop the machine:

```
vagrant halt
```

To force the machine off (the equivalent of pulling out the power cable):

```
vagrant halt --force
```

Don't run these yet!!

To destroy your local machine and its files

```
vagrant destroy
```

```
vagrant box remove ubuntu/wily64
```
